Dear Editors,

Please find enclosed the revised version of our manuscript entitled

**“Public-Data Causal Multiscale Wavelet Spillover Learning for
Stock Index Volatility Forecasting and Risk Early Warning”**

resubmitted for consideration as an *Article* in *Risks*.

We thank the reviewers for their careful and constructive evaluations. In this revision, we have addressed all comments and improved the manuscript in a focused way without altering the core empirical evidence. The main revisions include:

1. stronger economic interpretation of the medium- and long-scale spillover results, including their implications for market integration;
2. clearer positioning of the deep-learning comparison as a controlled benchmark rather than an exhaustive sequential-model sweep;
3. more explicit discussion of the practical economic significance of the forecasting and warning gains; and
4. improved signposting for finance-oriented readers in the methodology and discussion sections.

The revised manuscript remains fully based on public data and a strict walk-forward protocol. All preprocessing, wavelet decomposition, calibration, and warning-threshold estimation are carried out within each rolling training window to preserve causal integrity and avoid look-ahead bias.

For transparency, we have also prepared point-by-point responses to both reviewers and include them as non-published revision materials.

This manuscript is original work, has not been published elsewhere, and is not under consideration by any other journal. All authors have read and approved the revised version. There is no authorship change in this revision.

Thank you for your time and consideration.

Sincerely,

Aiping Jiang
